

NSPE 2010 COMPANY AWARD

Now in its 24th year, the annual competition was founded and organized by NSPE's Professional Engineers in industry interest groups as a vehicle for recognizing the efforts and foresight of those companies whose research and development policies bring new products to the marketplace.

The FOD Speed Slitter is one of the most efficient tools today for technicians to safely prepare flat fiber optic drop cables typically found in fiber-in-the-home networks. In just one motion, a twist of the cable allows the outer jacket to easily peel and separate from the buffer tube, leaving the fiber undamaged. The technician then snips off the loosened jacket and begins splicing.

This compact tool has no exposed blades and opens a range of flat FOD cables from multiple manufacturers. And the product's unique design also facilitates fast and safe mid-span access for technicians.
